ANEJO 5.- DATOS TOPOGRÁFICOS

1 INTRODUCCIÓN Y OBJETO DEL ANEJO

Como información de apoyo para la realización del presente proyecto se utilizó la siguiente documentación:

- Ortofotos en formato .ecw, en proyección UTM (ETRS89) huso 30.
- Cartografía con curvas de nivel cada 2 y 5 metros en proyección UTM (ETRS89) huso 30.
- Modelo Digital de Elevaciones LIDAR, nubes de puntos.

Dicha cartografía ha sido completada con la toma directa en campo, por procedimientos de topografía, mediante GPS Leica VIVA CS15, de los distintos elementos que componen la solución proyectada, fundamentalmente, puntos singulares y perfil longitudinal de las redes. Asimismo, se han realizado levantamientos específicos en las zonas de ubicación de las balsas, estaciones de bombeo, tuberías de admisiones eh impulsiones, redes de riego y cruces de carreteras.

2 METODOLOGÍA EMPLEADA PARA LA MEDICIÓN GPS

Para la toma de puntos con GPS se utiliza la conexión a La Red de Geodesia Activa de Aragón (ARAGEA) mediante conexión vía modem GPRS/UMTS para obtener las correcciones a tiempo real, consiguiendo un posicionamiento preciso en el mismo instante en que se efectúa el trabajo de campo.

El acceso a los datos en tiempo real se realiza a través del Caster NTRIP (Networked Transport of RTCM via Internet Protocol). NTRIP es un protocolo estándar diseñado para difundir en tiempo real los datos procedentes de receptores GNSS en Internet. Las correcciones suministradas por esta red son recibidas por el receptor GNSS que dispone de un cliente NTRIP, consiguiendo las correcciones diferenciales en tiempo real.

La Red de Geodesia Activa de Aragón (ARAGEA) está compuesta por veintidós estaciones propias distribuidas por el territorio de la Comunidad Autónoma de Aragón, dando respuesta a una creciente demanda en servicios de posicionamiento por satélite. Es un servicio libre y gratuito de posicionamiento de alta precisión con receptores GNSS (Sistema de Navegación por Satélite) dentro del territorio de Aragón en datum ETRS89, dentro de un marco coherente con la Red REGENTE y las estaciones permanentes del IGN y otros suministradores externos pero públicos. Dicha red proporciona correcciones de código y fase para los sistemas de navegación GPS, GLONASS y la futura GALILEO, tanto en tiempo real RTK como en postproceso a través de ficheros RINEX.

Al mismo tiempo, el sistema constituye un marco de referencia geodésico activo en ETRS89, que sustituye y complementa con ventajas a las tradicionales redes geodésicas basadas en vértices fijos.

Los vértices más empleados para la corrección son los más cercanos a la zona de proyecto, estación permanente de Huesca (OSCA) y estación permanente de Zuera (ZUER).

3 DATOS DE LA ESTACIÓN PERMANENTE EMPLEADA

A continuación, se incluye la ficha de la estación permanente utilizada como referencia para la corrección topográfica en tiempo real de la red.

APÉNDICE 2.- DEFINICIÓN GEOMETRICA

APÉNDICE 2.- DEFINICIÓN GEOMETRICA

Para la correcta ejecución de los trazados de tuberías detallamos a continuación los diferentes ramales. Definiremos en primer lugar el trazado en planta mediante un listado de todos sus puntos singulares y a continuación se definirá en alzado.
