## 1. METODOLOGÍA.

### 1.1. Información de partida.

La información previa inicial que utilizamos para la planificación de los trabajos es la siguiente:

- Red geodésica nacional
- Plano de la zona a levantar.

### 1.2. Medios empleados.

Para el trabajo de campo se ha utilizado:

- GPS TOPCON HIPER V, RADIO+GSM, de doble frecuencia
- DRON EBEE PLUS
- Señalización: CLAVO GEOPUNT
- Vehículos y material auxiliar

Para el trabajo de gabinete se ha utilizado:

- AGISOFT PHOTOSCAN PROFESIONAL
- PIX4D
- Auto CAD Map 3D 2018
- MDT 8.0
- GLOBAL MAPPER V17.0
- Trazado: KONICA MINOLTA C360

### 1.3. Toma de datos y cálculos.

#### GEODESIA

Los trabajos irán encuadrados en la Red Geodésica Nacional, estando las coordenadas de sus vértices referidas al Sistema de Referencia ETRS89, en el huso 29.

Las altitudes obtenidas serán siempre alturas ortométricas con origen en el nivel medio del mar en Alicante. Para el enlace altimétrico se realizarán enlaces con las redes de precisión del Instituto Geográfico Nacional, en caso de no existir estas se arrastrará cota desde algún vértice geodésico próximo o cualquier otro modo que garantice un nivel de aproximación adecuado al trabajo.

Se ha estudiado la red geodésica en las proximidades de la zona de actuación utilizando la red geodésica creada por el Instituto Cartográfico de Andalucía y enlazada con la misma empleando la siguiente estación permanente de referencia:

- HULV (13451M002)

#### RED TOPOGRÁFICA BÁSICA

La red básica se proyecta y observa de manera triangulada respecto a los vértices geodésicos utilizados, de manera que obtendremos una figura poligonal cuyos vértices exteriores serán geodésicos e interiormente estarán encuadrados los vértices topográficos. En el caso específico de emplear vértices geodésicos de la red REGENTE, en el caso de enlazar con un único vértice geodésico, existirán al menos dos vértices topográficos próximos al proyecto, de manera que las líneas base observadas generen un triángulo que nos permite controlar el cierre de la figura en coordenadas.

Dada las condiciones de la oferta presentada y teniendo en cuenta que únicamente se utilizará para la cubicación en un determinado momento del material existente, se implantó 1 vértice topográfico central desde el que se radió hacia el resto de la zona de actuación otros 2 vértices más (se adjuntan coordenadas en el anexo II). A partir de los mismos se podrán implantar para la ejecución de cualquier trabajo de replanteo cuantos vértices topográficos se precisen, en función de la operación concreta a realizar.

## PLANIFICACIÓN EN GABINETE

Las observaciones de campo se realizaron mediante técnicas de Sistemas de Posicionamiento Global (GPS), siendo precedidas por un estudio en gabinete sobre la geometría óptima de la distribución de satélites (GDOP), así como al estudio del calendario (fechas y horas en que se prevé mejor combinación geometría-número de satélites).

Para las correcciones diferenciales se han realizado mediante conexión de datos con la estación de referencia más cercada de la RAP, es decir, HUELVA, cuya reseña se adjunta al final del documento.

Una vez definido el itinerario y cobertura del Proyecto, lo plasmamos sobre cartografía HMTN 1/50.000, seleccionando los vértices geodésicos próximos a la zona. Además de señalar los vértices geodésicos, situaremos los vértices topográficos de aproximación al proyecto. Estos vértices topográficos tendrán una precisión similar a los vértices geodésicos, pero con la ventaja de que se sitúan en zonas de muy fácil acceso, con lo que mejorarímos considerablemente la productividad de los trabajos de campo, dando como resultado final una precisión final que oscilan entre de +/- 0,021 m.

El software empleado para la realización del modelo digital de elevaciones ha sido MDT V. 8.0 de la firma TCP-IT con nº de serie: 2226 registrado a nombre de AVANZA TCSIG, S.L.U.
